PROCUREMENT SECTION GURRENT SERIAL RECORDS

FOOD CONSUMPTION OF HOUSEHOLDS IN THE

WEST

SEASONS AND YEAR 1965-66

U.S. Department of Agriculture Agricultural Research Service

ACKNOWLEDGMENTS

The 1965-66 nationwide survey of household food consumption was conducted by the Consumer and Food Economics Research Division, Agricultural Research Service, U.S. Department of Agriculture. The sample was designed and the data were collected and processed by National Analysts, Inc., under contract with the Department. The data were tabulated by the General Electric Company, also under contract with the Department.

The study was carried out under the general direction of Faith Clark, formerly Director of the Consumer and Food Economics Research Division, Agricultural Research Service, and work on the survey was the concern of many individuals in the Division. Arletta M. Beloian was primarily responsible for the preparation of this report. Sadye F. Adelson, formerly chief, Food Consumption Branch, and Evelyn Grossman, chief, Survey Statistics Staff, shared the responsibility for

planning and supervising the study. Elizabeth Davenport, Ennis C. Blake, and Lillian Fincher (all retired) were responsible for monitoring the technical subject matter aspects of the data processing and tabulation performed by the contractors. Corinne LeBovit supervised the development of plans for coding and tabulating the data. Supervising the publication of the survey data was the responsibility of Daniel A. Swope, chief, Food Consumption Branch.

Many potential users of data were invited during the planning of the survey to make their needs known and to contribute their ideas. To this end, special attention was given by staff members of the Economic Research Service, the Statistical Reporting Service, and the Consumer and Marketing Service of the U.S. Department of Agriculture, as well as staff members of other Federal agencies.

FOOD CONSUMPTION OF HOUSEHOLDS IN THE WEST, SEASONS AND YEAR 1965-66/

By Consumer and Food Economics Research Division Agricultural Research Service 16,215f., mop. JAN 1973.

INTRODUCTION

This report presents survey findings on quantity and money value of food used by households in a week in each season and the average for the year. Averages are given for 12 income groups and all households for the year 1965-66 and for all households for the spring, summer, and fall of 1965 and the winter of 1966. This is the first time the U.S. Department of Agriculture has obtained data on the seasonal variations in food consumption from a nationwide sample of households.¹

This survey, which began in April 1965 and continued through March 1966, is part of the Department's ongoing research program on the food and nutrition of man started around 1900. Information on the kinds and quantities of food people eat as well as the amount of money they spend for food contributes to the knowledge of food habits in the United States. The nutrient content of the food reported as consumed indicates the dietary levels of different groups within the population. Thus, nationwide food consumption surveys are benchmarks to appraise trends, measure current variations, and identify needs for new changes in policies and new programs that will benefit the consumer. This information serves many needs.

- Congress, the Department of Agriculture, and other Federal agencies use these data to develop and administer public programs and policies that relate to the production, marketing, and distribution of food.
- Research and development laboratories, food manufacturers, and food industries use these data to bring the processing and marketing of food closer to the needs and wants of consumers. The seasonal data presented herein provide an important landmark in marketing information.
- Nutritionists, home economists, educators, and welfare workers use these data to assess the current nutritive value of diets of the population in the four seasons and to develop guidelines and programs for improving nutrition levels in the United States.

To obtain information on the Nation's dietary situation, the Department has made five nationwide surveys of food consumption over the past 30 years—in 1936,

1942, 1948 (urban only), 1955, and 1965-66. Unlike earlier surveys, data were collected for four consecutive seasons in the 1965-66 nationwide survey. Approximately 7,500 housekeeping households of one or more members were interviewed in the spring of 1965 (April-June), and 2,500 households were surveyed in each of the following three seasons: Summer 1965 (July-September), fall 1965 (October-December), and winter 1966 (January-March). Each of these seasonal samples was representative of the universe of housekeeping households but did not involve the same households. When the seasonal averages were combined for the year average, the smaller samples for summer, fall, and winter were given a weight of three.

Accordingly, the data for the year April 1965-March 1966 measure the average quantity and money value of major foods consumed by all households during a week. Annual household data for these measures are classified by region, urbanization, and income. It is not possible to derive a meaningful annual figure of the percentages of households using a food or a group of foods by combining seasonal percentages because different households were surveyed in the four seasons.

For individual seasons, this report contains information on the average quantity and money value of major foods, and the percentage of households using major foods during a week by urbanization category. No information by income categories is provided for the four seasons. Spring data by income classification were published in earlier reports. Summer, fall, and winter data by income are not being published because the smaller sample sizes used in these three seasons yielded unreliable data for some of the income subgroups. However, these data are available on request from the Consumer and Food Economics Research Division, ARS.

Households were selected to represent housekeeping households in each of the four census regions during each of the four seasons. Metropolitan areas, cities of various sizes, and rural farm and nonfarm areas in the conterminous United States were surveyed. To permit adequate farm coverage, farm-operator households were oversampled. Persons living on military reservations, in institutions, and in rooming and boarding houses were excluded. A more detailed description of the sample design for the West and its analysis are presented on pages 207 to 211 of this report.

Experienced interviewers collected the data by personal interview with a knowledgeable household member, usually the homemaker. They used a detailed

¹A 1948 survey of urban families included some seasonal data as reported in: Clark, F., Murray, J., Weiss, G. S., and Grossman, E. Food Consumption of Urban Families in the United States, With an Appraisal of Methods of Analysis. (1948 data.) U.S. Dept. Agr., Agr. Inform. Bul. 1932, 203 pp., illus. 1954.

food list to help the homemaker recall the kinds, quantities, and costs of foods, including alcoholic and other beverages, used at home during the 7 days preceding the interview as well as a count of meals eaten at home and away from home by cach household member. Expenditures for meals and snacks away from home paid for by family members were also obtained. In addition to family income, other household data, including the age, education, and employment of the homemaker, were collected for descriptive purposes. Households in the spring sample were also asked about the kinds of food that were home produced and home preserved during 1964.

Although consumption of a food by an individual family during a week often differs from the quantity purchased, average consumption for a large number of families tends to equal average purchases. As in earlier USDA surveys, food consumption is measured at the level at which the foods come into the kitchen.

The seasonal variability of household averages for quantities of major food items and the money value of food is summarized, in terms of an index, in table 28 of this report. The largest variation in money value from season to season occurred in home-produced foods. In the Northeast, North Central Region, and South, the money value of home-produced food per household averaged almost one-third higher in the summer than the year. Value of home-produced food in the West was about one-third higher in the fall.

For each season, in the West, about one-third of the dollar value of food at home in a week (money value of purchased and nonpurchased food) was allotted to meat, poultry, fish, and eggs, at least one-eighth to milk, cream, and cheese and slightly less than one-eighth to flour, cereal, and bakery products. The shares of the food dollar for nine major food categories are listed below. The averages for all urbanizations combined varied little with season.

Generally, the food dollar was divided in much the same way from season to season in the three urbanizations of the West, except for the following differences. In rural nonfarm households the portion of food money allotted to fresh fruit in the summer was double what it was in the winter. Particularly in the rural areas, the fall portion for meat, poultry, fish, and eggs was slightly larger than the other seasons.

Weights were used to compensate for the spring sample being 3 times the size of the samples for each of the other seasons and for oversampling farm households at 5 times the rate of other households. (See Sample Analysis, "Collection Counts"). Percents were computed from weighted counts. Households not classified by income are included in All Households and in seasonal distribution, excluded from income distribution, and shown in parentheses as percent of All Households.

Households not classified by income are mainly those not providing requested data, but 34 actual households are included (spring urban 13, rural nonfarm 1; summer urban 6, rural nonfarm 2; fall urban 4; winter urban 8) in which there was no economic family in the week preceding the interview or in money income year.

Description of Universe

Information for the 1965-66 study of consumption of food from household food supplies was collected by interviewing 15,112 households of one or more members. The households were scientifically selected to represent those in metropolitan areas, cities of various sizes, and rural farm and nonfarm areas in all parts of the United States except Alaska and Hawaii. Excluded were the approximately 5 percent of the population who were not housekeeping: 1.5 percent had not been visited because they were living in group quarters such as rooming houses, hospitals, and prisons; the other 3 to 4 percent were excluded when an initial screening indicated that they were in households in which no member ate as many as 10 meals from the home-food supplies. Interviewing began in all regions on April 3, 1965, and continued until April 2, 1966. Each family was asked to report on its food consumption for the 7 days preceding the interview.

Design

The 15,112 interviews were allocated by time and place so that optimum use could be made of the schedules for the various kinds of analysis units. Thus half the schedules (7,532) were collected in spring 1965 and the other half distributed equally among the three other seasons (summer and fall 1965 and winter 1966).

The sample design provided, in each season, for a national self-weighting basic sample plus a supplementary farm sample which overweights the number of farm households in the proportion of 5:1. The weights used for unifying the schedules in proportions appropriate to the season and urbanization distributions are shown in the section "Collection Counts."

The households to be interviewed were selected in accordance with a multistage area sample design with added control by season.

Delineation of 106 strata with equal number of households was accomplished by dividing conterminous United States into 27 classes—nine geographic divisions by three population density classes. These classes were created by a primary break between Standard Metropolitan Statistical Areas (SMSA) and nonmetropolitan areas with a further breakdown in the SMSA's between the central city (50,000 or more) and the areas not in the central city. Within each of the 27 classes, State Economic Areas were identified and combined into strata containing approximately a half million households. The strata allocation is as follows:

	m		Standard Metropolitan Statistical Area					
Region and division	Total	Central city	Outside central city	Nonmetro- politan area				
Total	106	40	28	38				
Northeast: New England	6 20	2 10	2 6	2 4				
North Central: East North Central	20 10	8 2	6 2	6				
South: South Atlantic	16 7 9	4 2 4	4 1 1	8 4 4				
West: Mountain	5 13	2 6	1 5	$\frac{2}{2}$				

Central cities are entirely urban. Other parts of the SMSA's and the nonmetropolitan areas are both urban and rural.

For the basic sample, 144 first-stage units of expected size of 10,000 households were selected at random—one from each of the 68 SMSA strata (40 in the central city and 28 outside) and two from each of the 38 nonmetropolitan strata as shown by region in the following table:

D .	77.41	Standard I Statist	Nonmetro-	
Region	Total	Central city	Outside central city	politan area
Total	144	40	28	76
Northeast	32	12	8	12
North Central	42	10	8	24
South	48	10	6	32
West	22	8	6	8

Within each first-stage unit, second-stage units of 30 expected housing units were selected, also at random—approximately 19 from each SMSA stratum and 9 or 10 from each nonmetropolitan stratum. There were approximately 2,000 second-stage units in the basic sample.

² Divisions, Standard Metropolitan Statistical Areas and cities as defined by U.S. Bureau of the Census in U.S. Census of Population: 1960.

³U.S. Bureau of the Census, State Economic Areas: 1951.

Each of the second-stage units was visited and a list of housing units prepared. By systematic selection, housing units were chosen for interview in the spring in sufficient number to yield an average of three schedules per second-stage unit after allowing for vacancies and ineligibles or otherwise nonparticipating households. The lists were updated in the summer, in the fall, and in the winter, and a sufficient number of households were chosen to yield an average of one schedule per second-stage unit in each of these seasons. The four seasonal samples were selected independently by using different random starts in the second-stage units.

The farm household universe is relatively small. If it had been represented in its true proportion, there would have been too few schedules to support analysis. Therefore, a supplementary farm household sample was added to the basic sample. This supplement of about 500 second-stage units was drawn from the 104 previously selected first-stage units in the nonmetropolitan areas and the parts of the SMSA's outside the central cities. These second-stage units were allocated between the metropolitan and nonmetropolitan sectors in proportion to the estimated number of farm households, but inadvertently, selection was made with probability proportionate to total number of households. Field collection showed that "total households" was not a good indicator of farm household distribution within the metropolitan sector. To prevent underrepresentation in this sector, 40 of the second-stage units were withdrawn and 35 others were doubled in size.

No substitutes were provided for households unable or unwilling to participate in the survey. Interviewers were instructed to call as many as three times if necessary to make the original contact in rural places, four times in urban places, and six times in 281 second-stage sample units in 15 large cities where collection difficulties were anticipated.

Collection Counts, Seasons and Year 1965-66

In the West 2,045 households provided schedules. These are equivalent to a self-weighting sample of 1,213. The distribution by season and urbanization is as follows:

Season and urbanization	Schedule counts	Weighted counts
Year-all urbanizations	2,045	1,213
Urban	1,584	1,053
Rural nonfarm	182	123
Rural farm	279	37
Spring—all urbanizations	1,027	304
Urban	796	265
Rural nonfarm	89	30
Rural farm	142	9
Summer—all urbanizations	331	290
Urban	252	252
Rural nonfarm	28	28
Rural farm	51	10

Season and urbanization	Schedule counts	Weighted counts	
Fall—all urbanizations	342	305	
Urban	261	261	
Rural nonfarm	35	35	
Rural farm	46	9	
Winter—all urbanizations	345	313	
Urban	275	275	
Rural nonfarm	30	30	
Rural farm	40	8	

The weighted counts differ from the number of households scheduled for two reasons. First, in each season, collection of farm schedules was designed to be five times as great as required by relative number in the population. To compensate, each farm schedule was assigned a weight of one-fifth. The second weight was to equalize the importance of schedules collected in each season. Thus each spring schedule was assigned a weight of one-third to compensate for collection at three times the rate of that in the other seasons. Farm schedules collected in the spring had both weights applied. The tabulation of spring data alone did not require the second weight and the spring publications show weighted counts three times the size of these.

The data shown in this report were computed from all schedules with weights as follows: Urban and rural nonfarm—spring 0.3333, other seasons 1.0000; rural farm—spring 0.0667, other seasons 0.2000.

In the collection process, not all housing units yielded schedules. Sometimes no one was contacted even after repeated visits. In some households no member ate at least 10 meals from the home-food supply during the 7 days preceding the interview; therefore, they were ineligible for the survey. Some eligible families were unwilling or unable to participate. The eligible nonparticipants constituted about 20 percent of the eligible households in this survey for all regions combined. Many past studies have shown that nonparticipation rates are higher in urban than rural communities. Information on participation rates and on the count of households never reached are not available for this report.

Appraisal

The households in the West contributed 15 percent of the schedules collected during the year. Although these households provide their proportionate share toward the national picture, the number of schedules is small for regional analysis. There are only 60 percent as many schedules from the West as from the Northeast, the region with next smallest number of households. The data published in the spring report are based on 1,000 schedules, 800 of them urban and these sample

sizes might be expected to yield reliable data. The urban samples in the other seasons and the rural nonfarm, for the year as a whole, are of marginal size with between 250 and 280 schedules. The rural samples, both farm and nonfarm for summer, fall, and winter, consist of between 30 and 50 schedules. Average consumption data are shown for the small samples so that their contribution to the larger annual, regional, and urbanization samples can be noted.

Households reporting food consumption but not income constituted 7 percent of the total sample in each season. For the year, 7 percent of the urban, 9 percent of rural nonfarm, and 5 percent of the farm respondents were not classified by

income. Nonreporting of income by urbanization within season was of the same general magnitude, except in the summer when seven of the 28 rural nonfarm households did not report income.

Table 29 shows some characteristics of the households in each sample. These characteristics ought to be examined so that possible differences in "mix" would not be attributed to seasonal consumption differences. In view of the sample sizes, the characteristics are remarkably similar, but only the total region and the urban samples are worth evaluating. For these there are no discrepancies that might be expected to introduce bias in the food consumption data.

YEAR AND SEASONS 1965-1966

^{*} LESS THAN 0.5 PERCENT

DEFINITIONS AND EXPLANATIONS

All Urbanizations.—Includes all households in the urban, rural nonfarm, and rural farm urbanization categories. See "Urbanization."

Bought Food.-See "Source of Food."

Donated Food. - Federally donated food only. See "Source of Food."

Eggs Fresh Equivalent.—Quantity of frozen, dried, or liquid eggs without shell, whether the whole egg, whites, or yolks only, converted to the weight of equivalent amounts of eggs in shell.

Eligible Households.—Those with at least one person having 10 or more meals from the household food supply during the 7 days preceding the interview.

Family.—Persons living alone or a group of persons living together and drawing from a common fund for the major items of expense, such as food, housing, and automobile. Unmarried sons and daughters of any age if living at home were considered part of the family. Other persons, related or unrelated, living with the family were included only if they drew from a common family fund for the major items of expense.

Any persons who were usually part of the family but who were temporarily away from home—at school, at work, in the hospital, or on vacation—were included with the family. However, sons or daughters in the Armed Forces who were quartered away from home on military installations were not considered part of the family.

Farm Household. -A household that included a farm operator at the time of interview.

Farm Operator.—A person who at the time of the interview made the decisions and controlled the operation of property consisting of (1) 10 or more acres yielding sales of at least \$50 in 1964 or (2) fewer than 10 acres yielding sales of at least \$250 in 1964 or (3) land expected to yield sales in 1965 meeting either of the above specifications.

The farm operator performed the labor himself or directly supervised it. He was an individual operator or had one or more partners and either owned or rented the property by cash or eropping arrangement. The operator's dwelling unit did not have to be located on the farm property.

Food at Home.—Food and beverages (aleoholie and nonaleoholie) from the household food supplies "used" during the 7 days before the date of the survey interview. This included food and beverages eaten at home, earried from the home

in packed meals, thrown away, and food fed to pets. Food fed to animals raised for commercial purposes and commercial "pet" food were omitted. Food that was obtained with eash, credit, food stamps, coupons, or food vouchers, and food that was home produced, federally donated, received as a gift or payment for goods and services, or received from welfare agencies was included.

Any food from the respondent's household that was given away for use outside the home, such as food sent to sons in the military service, gifts of food donated to a church supper, or food given to household help to take home, was also excluded from food at home.

Food used at home was classified by form-fresh, commercially canned or frozen, home-canned or frozen, and dried or dehydrated. Generally, the food used at home was reported in the form in which it was brought into the kitchen.

Concerning homemade mixtures, the period of preparation relative to the interview date determined the procedure for recording them on the schedule. If the mixture used was prepared from home food supplies during the 7 days of the survey week, the kind and amount of each ingredient were recorded. For example, a homemade eake prepared anytime within the survey week was included with quantities of flour, eggs, sugar, fat, and milk. But a homemade mixture used during, but prepared before, the survey week was recorded in the name of the product in the same way as a commercially prepared mixture was recorded. To illustrate, a cake that was prepared at home on any day before the survey week, or a bakery eake that was brought from the store into the kitchen, was entered on the schedule as a ready-to-eat eake.

If home-canned or home-frozen vegetables and fruit and home-preserved jelly, jam, piekles, or relish were processed before the survey week they were also recorded in the same way as commercially prepared mixtures. However, when the eanned, frozen, or preserved food was made at home during the 7-day period, only the ingredients of the portion used during that period were recorded.

Food at Home Not Bought.— Food used at home that was home produced, donated, and received as a gift or instead of pay. See "Source of Food."

Food Away From Home.—Any food and beverage (alcoholie and nonaleoholic) in meals and snacks purchased by the family for themselves and their guests away from home during the week. The expense for such food and beverages included sales tax and tips. Food eaten by the family in other homes or elsewhere as guests or employees for which no family expense was involved was not included in expense for food away from home. See "Food Away From Home Not Bought."

Food Away From Home Not Bought.—The number of meals with no family expense, that is, meals eaten by the family in other homes or elsewhere as guests or employees.

Home-Produced Food.-Sec "Source of Food."

Household.—A family or a group of unrelated persons who lived together and their guests, boarders, and hired help.

Household Size.—The total number of meals served to all persons in the household from family food supplies divided by 21 (based on three meals a day for 7 days for one person) to obtain the household size in equivalent persons. When meals reported eaten at home and away from home did not add to 21 meals for each person, the skipped meals were distributed as bought, free, and from household food supplies in the same proportion as the reported meals. The count of equivalent persons was not adjusted for between-meal snacks or additional meals, such as those served to invalids or young children. However, the meals served to guests, boarders, and hired help were included.

Lunches carried from home, but supplemented by other food purchased, received as a gift, or received instead of pay, were counted as one-half meal at home and one-half meal from one of the other sources; lunches supplemented only by beverages were counted as full meals at home.

Refreshments served to guests were also counted in the total meals from household food supplies, but were not given the same value as a full meal. Servings of a single food or two, for example, a glass of milk or a cup of coffee and a doughnut, were considered light refreshments and counted as one-fourth meal for each guest. More than two refreshment items served at one time, such as ice cream, cake, and coffee, were counted as one-half meal for each guest served. Any refreshments served to persons who were part of the family were not counted unless they substituted for a regular meal.

Milk Products Measures:

Calcium equivalent: Quantity of whole fluid milk to which dairy products (except butter) are equivalent in calcium content. The chief source of data on the calcium content of the various dairy products was "Composition of Foods-Raw, Processed, Prepared," U.S. Department of Agriculture, Agriculture Handbook No. 8, December 1963.

Fat content and nonfat solids content: Quantity of milk fat (in pounds) and of milk nonfat solids (in pounds) contained in milk, cream, ice cream, and cheese used by households in a week. The source of most of the factors was "Conversion Factors and Weights and Measures for Agricultural Commodities and Their Products," U.S. Department of Agriculture Statistical Bulletin No. 362, June 1965.

Money Income.—Respondent's estimate of the family's 1964 money income (after deduction of State and Federal income taxes) for spring and summer and 1965 money income for fall and winter within one of the income classes grouped by \$1,000 increments up to \$12,000 and by broader income ranges above \$12,000 up to \$25,000 or more.

Money Value of Food Used at Home.—Price paid for bought food "used" in the survey week regardless of the time of purchasc. Sales tax was excluded. Bought food with unreported prices, food produced at home, and food received as a gift or instead of pay were valued at prices paid for similar items by other families in the same region and urbanization. Federally donated foods were valued at average retail prices from the Bureau of Labor Statistics commodity index for the United States.

Not Classified by Income.—Households that were not families at the time of the survey or for the year 1964 and households in which respondents were either unable or unwilling to give information about income. See "Family."

Rural Farm. - See "Urbanization."

Rural Nonfarm. - See "Urbanization."

Seasons._

Spring: April, May, and June 1965.

Summer: July, August, and September 1965. Fall: October, November, and December 1965.

Winter: January, February, and March 1966.

Source of Food.—Classification of food as bought, home produced, federally donated, or received as a gift or instead of pay.

Bought: Food received for cash, on credit, with Federal food stamps (coupons), or with vouchers. Also includes home-canned, home-frozen, and home-baked goods if the major ingredient was purchased.

Home-produced: Food raised for home use and food obtained by hunting, fishing, and gathering from the wild.

<u>Donated</u>: Food from USDA's Direct Distribution Program issued to low-income families by State and local welfare agencies.

Gift or pay: Food received as a gift or from an employer.

Urban. - See "Urbanization."

Urbanization.—Distinction between urban and rural households was based on the size of place in which the dwelling was located. Within the rural category, distinction between farm and nonfarm households was based on the presence of a farm operator. Definitions are those used by the Department of Commerce for the Population Census (1960) and the Agriculture Census (1964).

All households: Composite of urban, rural nonfarm, and rural farm households appropriately weighted.

<u>Urban:</u> Households in places with at least 2,500 inhabitants and in closely settled fringe areas surrounding cities of 50,000 or more inhabitants.

Rural nonfarm: Households outside of urban places without a farm operator.

Rural farm: Households outside of urban places with a farm operator.

Weights. - See "Sample Analysis."

Year.-See "Seasons."
